Customized Designs

We offer wide variety of ergonomically designed screw driver handles & blades tips. Some of the customized designs are indicated below for ready reference.

Handles

Blades

Blade Tips

Do's & Don'ts

- To minimize risk of injury, always wear eye protection.
- When using a screwdriver, always position the tip directly over the fastener to completely engage the tip before turning. A misaligned screwdriver will definitely damage the fastener and over time, will eventually cause excessive wear and tip failure.
- Use the correct size tip for the size of screw head. This will help prevent the tool from slipping. If the tip is too big it may damage or mark the work piece. If the tip is too small it may damage the fastener and in most cases, one will damage both and possibly harm oneself.
- Try not to use a screwdriver with rounded or worn edges or tips. The screwdriver will not fit the fastener properly, will slip out of the fastener, and will cause damage to the fastener or the work piece or user and possibly all of the above.
- If you need extra leverage to loosen or tighten a stubborn fastener, use the proper tool. Never use locking or slip-joint pliers on the handle of a screwdriver to get extra turning power. This may help you turn that stubborn fastener now, but will mark and gouge the handle and make it uncomfortable to use in the future. There are screwdrivers specifically designed for that purpose, either with a square or hex shank or a drive in the butt of the handle.
- Always use each type of screwdriver for its intended use. Never use a screwdriver as a pry bar, chisel, punch, scraper or alignment tool. You will most likely ruin the tool, cause damage to your work and possibly risk injuring yourself.
- The most common misuse is using your slotted screwdriver to open a paint can and then stir the paint. Neither is a good idea. Opening that paint can may bend the tip slightly enough that it won't fit in a fastener or break it completely. Using it to stir that paint will leave a residue build-up that may cause the tip to be too big to fit the fastener.
- Unless absolutely necessary, never hold the work piece in one hand while using the screwdriver with the other. When, not if, the screwdriver slips out of the fastener, the tip of that screwdriver will find its way into your other hand and you will possibly injuring yourself.
- Never grind or subject the tip to heat. Heat can affect the temper of the metal and weaken the tool. Never use a screwdriver near live electricity. The blade is metal and conducts electricity and not all handles will insulate you from the current.
- Never carry a screwdriver in your back pocket.
